Yes, I understand the issue from the screenshot. The important thing is:
`CloneCommand.ExecuteClone` is a Visual Studio clone error, not an error in your ASP.NET/Angular code.

Your team member is probably trying to **clone the GitHub repository after you invited them**.

First check these 3 things

1. They must accept your GitHub invitation

Tell your team member:

GitHub → Profile → Notifications / Invitations → Accept invitation

Until they accept the invitation, they may not have access to the private repository.

2. They should clone the correct repository

Your repository is:

LoanApplicationFullStack

and the GitHub URL is:

https://github.com/shreyaDhole131/LoanApplicationFullStack.git

They should **Clone**, not Pull, the first time.

In Visual Studio:

Git
↓
Clone Repository
↓
GitHub
↓
Repository URL

Use the repository URL above.

---

3. If Visual Studio still gives `CloneCommand.ExecuteClone`

Ask your team member to try cloning through **Developer PowerShell** instead of Visual Studio.

git clone https://github.com/shreyaDhole131/LoanApplicationFullStack.git

If it works, they will get:

LoanApplicationFullStack

Then:

cd LoanApplicationFullStack
git branch -a

They should see branches such as:

main
remotes/origin/main
remotes/origin/shreya

Then they can create their own branch.

For example, if the member is `khushi`:

git checkout -b khushi origin/main

Then work on their branch.

Important distinction

First time:

Clone repository

After they already cloned it:

git pull
